

4. Perform basic Image Handling and processing operations on the image Read an image in Python and Dilate an Image using Dilate function.

Aim:

To perform basic image handling operations by reading an image in Python and applying Dilate Function and Image Handling using the OpenCV library.

Procedure:

- Import the required libraries such as OpenCV (cv2) and NumPy.
- Read the input image using the cv2.imread() function.
- Create the required kernel/parameters for image processing.
- Apply the required image-processing operation using the appropriate OpenCV function.
- Display the original and processed images using cv2.imshow() and close the windows using cv2.destroyAllWindows().

Code:

```
import cv2

import numpy as np

image =

cv2.imread(r"C:\Users\Maruthi\Downloads\FLOWER.png")

kernel = np.ones((5,5), np.uint8)

dilate = cv2.dilate(image, kernel, iterations=1)

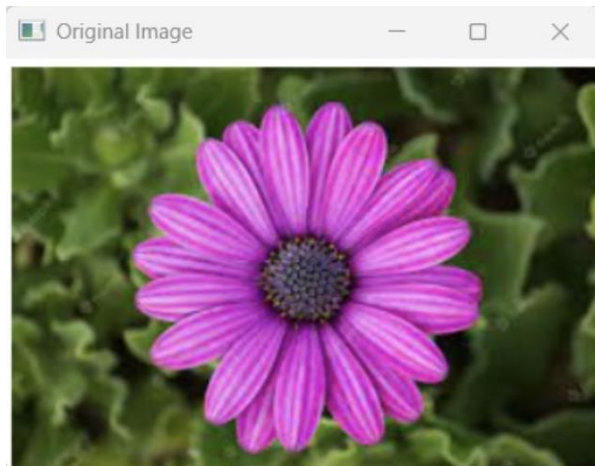

cv2.imshow("Original Image", image)

cv2.imshow("Dilated Image", dilate)
```

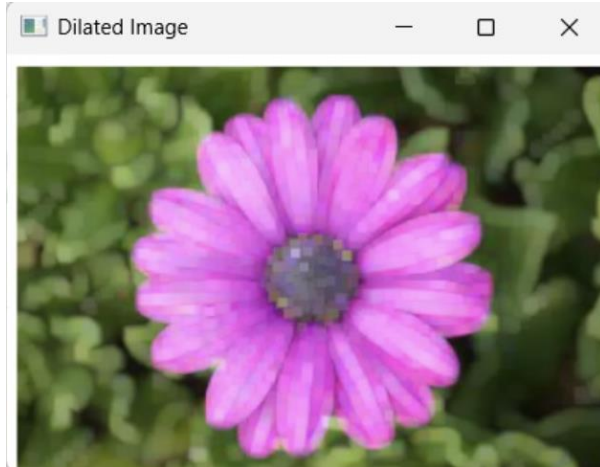

```
cv2.waitKey(0)
```

```
cv2.destroyAllWindows()
```

Sample Input

Sample Output

Result:

The input image was successfully read using Python and processed using the Dillate function.
